

Stavelly Minerals is committed to fully rehabilitating farmland and the environment immediately following its mineral exploration activities.

Prior to drilling of an exploration site, a photographic record is taken and any significant vegetation is identified and fenced off.

All reasonable measures are taken to minimise the impact of the drilling operation on the environment.

On completion, the drill site is fully rehabilitated to as good as, if not better, than its previous state.

**“We want to leave a property in better condition than when we came onto that property.”**

**Chris Cairns, Managing Director Stavelly Minerals**

Rehabilitation process:

- Cut any protruding drill collars to 40cm below ground level and plug the hole
- Backfill hole and mound with surplus material to allow for settling
- Restore original land contours of drill site
- Remove all foreign material and samples and dispose of in an approved waste facility
- Shallow rip of the site and associated access tracks (if required) to overcome soil compaction
- Apply seed to achieve desired rehabilitation outcome (eg. pasture, crop, native seed) if required.
